INTERNSHIP PRESENTATION

Operations Industrial Engineer Job Simulation

A Virtual Job Simulation Program by Siemens, hosted on the Forage platform

STUDENT NAME

Aditya Raj

PROGRAM & SEMESTER

B.Tech CSE (Core), 3rd Semester

SECTION

2CSE29

ENROLLMENT NUMBER

25SCS1003002570

BATCH

2025 – 2029

ORGANIZATION

Siemens (via Forage)

What This Presentation Covers

01

About Siemens

Global technology leader in industrial automation & operations

02

About the Simulation

Forage's virtual Operations Industrial Engineer job simulation

03

Objectives

Goals set out for the internship simulation

04

Task 1: Time Studies

Analyzing process timing to improve efficiency

05

Task 2: Layout Changes

Proposing improved facility layouts

06

Key Learnings

Skills and insights gained from the experience

About Siemens

Siemens AG

A global technology powerhouse headquartered in Germany, Siemens focuses on industry, infrastructure, mobility, and healthcare — helping customers digitalize and automate their operations.

Siemens' Digital Industries division builds tools and simulations that give students hands-on exposure to real industrial-engineering workflows.

- **Industry**

Industrial Automation & Digitalization

- **Focus Areas**

Automation, Electrification, Digitalization

- **Simulation Host**

Forage Virtual Experience Platform

- **Relevance**

Real-world operations & industrial engineering practice

About the Job Simulation

Forage partners with leading companies like Siemens to design free, self-paced virtual job simulations. These replicate the real tasks employees handle on the job, giving students authentic, practical exposure before entering the workforce.

PROGRAM

**Operations Industrial
Engineer Job Simulation**

PROVIDED BY

**Siemens, via the
Forage Platform**

DURATION

**Completed over the
period of September 2026**

OUTCOME

**Verified Certificate
of Completion**

Verification: Enrolment Code 6aa2dfc57b6283118cd6b8c3 | User Code 6aa2dc0039befb14b5a25af7

GOALS

Objectives of the Internship

Understand Time Studies

Learn to measure and analyze task durations within a production process to identify inefficiencies.

Improve Facility Layout

Apply industrial engineering principles to propose a more efficient plant/floor layout.

Boost Operational Efficiency

Translate data-driven analysis into practical recommendations that reduce waste and cost.

Build Practical IE Skills

Gain hands-on experience with the tools and thinking used by real operations industrial engineers.

TASK 01

Conducting Time Studies

A time study is a structured technique used to record and analyze how long it takes a worker or machine to complete a specific task. As part of the simulation, I studied production process timings to spot bottlenecks and inefficiencies in the workflow.

- 1 Observed and timed each step of the selected production process
- 2 Recorded cycle times across repeated task iterations
- 3 Identified steps consuming disproportionate time
- 4 Calculated standard time and highlighted improvement opportunities

Why It Matters

Accurate time studies form the foundation for setting fair production standards, balancing workloads, and pinpointing exactly where a process loses time.

OUTPUT

A documented time-study report highlighting bottlenecks

TASK 02

Proposing Layout Changes

Goal

Redesign the physical arrangement of workstations and equipment to minimize unnecessary movement and maximize throughput.

OUTPUT

A proposed layout plan with supporting rationale

Using insights from the time-study analysis, I proposed changes to the facility layout aimed at reducing travel distance between workstations and removing process bottlenecks.

1

Mapped the existing workstation layout and material flow

2

Identified areas of congestion and excess movement

3

Modeled an improved layout to shorten travel paths

4

Justified the proposal using time and efficiency data

APPROACH

Methodology & Tools Used

Core skill areas practiced: Process analysis • Data-driven decision making • Workplace/facility design • Technical reporting

Key Learnings & Skills Gained

Time-Study Technique

Learned a repeatable method to measure and standardize task timing in real operations.

Layout Optimization

Understood how physical workspace design directly impacts efficiency and cost.

Data-Driven Thinking

Practiced turning raw observations into actionable, evidence-backed recommendations.

Industrial Engineering Mindset

Gained a practical view of how IE principles are applied in a real company setting.

Problem Solving

Improved ability to identify inefficiencies and propose realistic solutions.

Professional Readiness

Built confidence with an industry-recognized simulation from a global company.

Conclusion

The Siemens Operations Industrial Engineer Job Simulation, completed via Forage, offered valuable hands-on exposure to core industrial engineering practices — from conducting time studies to proposing data-backed layout improvements.

This simulation strengthened my analytical thinking, attention to process detail, and ability to translate observations into practical recommendations — skills directly relevant to a career in operations and industrial engineering.

Overall, it was a rewarding, practical introduction to how real organizations like Siemens approach operational efficiency.

Certificate of Completion

Aditya Raj

Operations Industrial Engineer Job Simulation
Issued by Forage • September 10, 2026

THANK YOU

Questions & Discussion Welcome
